FAQ

Linux Hosting

What are the different hosting plans that 1&1 offers?

1&1 provides a selection of hosting plans all of which can be ordered either with Linux or Windows server. If you just want a basic online presence, the small hosting package is the ideal solution. If you have more advanced projects in mind, choose one of our larger hosting packages. For businesses, we recommend our largest hosting package. All three hosting packages come with sufficient amount of Webspace. All hosting plans include dual hosting, protecting your website by storing your data simultaneously in our high-tech data centers in two separate locations.

Do I get a free domain when I register for a 1&1 Web Hosting package?

For your initial 12-month contract term, 1&1 offers you a domain which is free for the first year. Choose your domain from a list of extensions such as .com, .net, .org, .info, .us, .biz, .co, and many more. Additionally, 1&1 offers you free 24/7 Support.

Can I use different web addresses on my hosting package?

Yes, you can use different web addresses for your 1&1 hosting packages. You can host as many web addresses as you like, from hosting multiple subdomains to hosting unlimited external domains. Other features include URL-Masking, domain access without the www. prefix, and DNS Management. URL-Masking is a type of domain forwarding, which automatically sends the user to the destination page without

changing the URL address. A Domain Name System (DNS) is a system that translates a domain name as we know it into the computer recognized IP address form. This enables computers to communicate in their IP language. By having access and control over your DNS you can point your domain names to any static IP address or host name, use the 1&1 name servers to set your own mail servers, point your external domains to your 1&1 servers, and even transfer your external domains to 1&1 for free.

I want to build a website based on WordPress. Can I host it on 1&1?

Yes, you can host your WordPress website on 1&1! All 1&1 web hosting packages provide the necessary processing power and memory capacity for your WordPress websites. The 1&1 Linux servers support the PHP and MySQL technical standards required to run WordPress. Our affordable web hosting packages are also customized for WordPress project requirements. If your project grows and you need more web space, you can easily order it. Besides all the features that WordPress already has to offer, 1&1 will provide you with a selection of Click & Build options which are easy to implement in order to improve your website.

Which Linux distribution is used for hosting?

We use the Debian Linux distribution for our web hosting. Debian is a flexible and beginner-friendly operating system with minimal system requirements that includes a diverse array of applications and utility programs. Debian has been continuously evolving since 1996 and the extensively tested OS (operating system) can now be installed on every modern Linux server. The Debian Linux hosting package from 1&1 delivers a reliable and safe software base for all your content and websites.

Can I choose/change the Linux distribution?

No. As a customer you do not have direct access to the operating system of the server. In the shop you can either opt for the current Linux or the current Windows version. Use our handy comparison Linux vs. Windows to determine which of these two operating systems and their specific features and advantages is best to meet your hosting needs. Whichever operating system you decide on, we ensure that the latest version of Linux or Windows is always available to you. You profit from increased safety and are free to concentrate on what is important: your website and its content.

What are the advantages of Linux hosting?

Linux and Windows have both proven themselves to be a powerful base for the creation of extensive websites. Both operating systems offer all the basic functions that are necessary to run a website. For Linux, countless open source applications are available additionally and the use of certain features like MyWebsite or click & build apps is only possible with Linux-based hosting. Our top PHP features such as Extended Support and OpCache are currently also only available in the 1&1 Linux packages. What's more, you can use Linux webhosting without a problem, even if your computer or laptop operates on Windows. Connecting external servers and terminal devices is simple.

Can I change my operating system later on?

You can change the operating system of your server from Linux to Windows or from Windows to Linux at any time through a change in tariff. To swap operating systems go to our customer shop. Your website and its content will be moved from a Linux server to a Windows server or vice versa. Just let us know, we're happy to help.

Do I need prior knowledge of Linux?

No, as a customer you do not need any knowledge of the operating system of your server, which is a complex, closed system that you do not have direct access to. Instead, we will do all the required technical and administrative maintenance, security, back-up and updating work for you, so the full scope and functionality of your 1&1 webhosting package is always available to you. All other relevant work, like integrating your content, installing sub-domains or creating e-mail addresses can be done easily via a special management interface, without having to work directly with the operating system.
